General product information:

The equipment covered by this report is medical power supply, which can be used as a part of medical equipment. The different models are corresponding to four structure types respectively.

The equipment is consisted of electronic components mounted on PWB then housed with plastic enclosure which secured together by ultrasonic welded.

The equipment contains three types of output connector: USB type-C, dual USB type-A and one USB type-A.

All the types are designed for continuous operation and no applied part is defined.

The insulation construction of the equipment is evaluated as 2MOPP in this report as the client's request.

Model differences:

Explanation of model designations GT*46161-**-*:

The 1st symbol "*" denotes "M" or "-" or "H" for market identification and not related to safety.

The 2nd symbol "*" denotes the rated output wattage designation, which can be "01" to "16", with interval of 1.

The 3rd symbol "*" denotes the standard rated output voltage designation, which can be "5.0" to "5.5" or "05" to "05.5" with interval of 0.1 Vdc.

The last symbol "*" denotes the types of output connector: -USB means Type 1 one USB type-A, -USB1A means Type 2 one USB type-A, -USB2A means Type 2 dual USB type-A and -USBC means Type 2 USB type-C.

There are two types of circuit diagram and PCB layout, the details as below:

Circuit diagram / PCB layout	Fuse	Output type
Type 1	Fusible resistor (RF1) & fuse (FS1)	one USB type-A

Type 2	Fusible resistor (RF1) or fuse (RF1) & fuse (FS1)	one USB type-A, dual USB type-A and USB type-C
Note: Circuit diagram / PCB layout of type 1 and type 2 are similar except for fuse type, location of C5 and secondary component (LF2).		

Model list

Model	Rated output voltage range	Max. rated output current	Max. rated output power
GT*46161-*5.0-* GT*46161-*05-*	5 Vdc	3.2 A	16 W
GT*46161-**-* (The 3rd "*" can be "5.1" to "5.5" or "05.1" to "05.5"	5.1-5.5 Vdc	3.14 A	16 W

Technical Considerations:

Models GTM46161-165.0-USBC is tested as typical models. Transformers used in all models are with same construction. The turns of secondary winding may be added or reduced according different output voltage. All models have same PCB, but some non-critical components may be adjusted according different output voltage. The parameters of these components depended on output voltage.

The equipment is intended to use in environment which altitude up to 5000 m, the air clearance is multiplied by the altitude Multiplication factor: 1.48 for MOOP and 1.29 for MOPP, which specified in Table 8.

Scope of power supply evaluation defers the following clauses to be determined as part of the end product investigation:

Clause 7.5 – Safety Signs
Clause 7.9 – Accompanying Documents are provided for some critical issue like technical data, safety warnings, necessary information to set up, but further evaluation is needed on end product level
Clause 8.11.5 – Mains Fuse with High Breaking Capacity
Clause 9 – ME Hazard, except 9.1 and 9.3 are evaluated
Clause 10 – Radiation
Clause 11.7 – Biocompatibility
Clause 14 – PEMS
Clause 16 – ME Systems
Clause 17 – EMC

Report Summary:

This report is reissued to include the following changes and/or, which were considered technical modifications:

- Transferred CBTL from Intertek Testing Services Shanghai to Intertek Testing Services Taiwan Ltd.
- Revised model name from GT*46161-**-USB to GT*46161-**-*.
- Added alternative types of USB output port and then revised model differences.
- Updated Table 8.10 List of critical components.

This report is a reissue of CBTR Ref. No.: 170500749SHA-001, CB Test Certificate Ref. No.: SE-87772. Based on the previously conducted testing and the review of product construction, technical documentation including photos, schematics, wiring diagrams and similar, the tests which listed Summary of testing in Page 5 were deemed necessary.

INSULATION DIAGRAM CONVENTIONS and GUIDANCE:

A measured value must be provided in the value columns for the device under evaluation. The symbol > (greater than sign) must not be used. Switch-mode power supplies must be re-evaluated in the device under evaluation therefore N/A must not be used with a generic statement that the component is certified.

Insulation diagram is a graphical representation of equipment insulation barriers, protective impedance and protective earthing. If feasible, use the following conventions to generate the diagram:

- All isolation barriers are identified by letters between separate parts of diagram, for example separate transformer
  windings, optocouplers, wire insulation, creepage and clearance distances.
- Parts connected to earth with large dots are protectively earthed. Other connections to earth are functional
- Applied parts are extended beyond the equipment enclosure and terminated with an arrow.
- Parts accessible to the operator only are extended outside of the enclosure but are not terminated with an arrow.
